

Thank you for providing the context. To display the quiz questions randomly, you can use the `shuffle()` function to shuffle the array of questions when the component is created. Here's an example implementation:

php

 Copy code

```
<template>
  <div>
    <!-- Stepper component to display the three levels -->
    <stepper :steps="steps" :activeStep="activeStep" />

    <!-- ProgressBar component to display progress -->
    <progress-bar :current="currentQuestion" :total="totalQuestions" />

    <!-- Questionnaire component to display questions -->
    <questionnaire
      :questions="shuffledQuestions"
      :currentQuestion="currentQuestion"
      :selectedAnswer="selectedAnswer"
      :answerSubmitted="answerSubmitted"
    />

    <!-- Results component to display results -->
    <results
      :questions="questions"
      :score="score"
      v-if="quizCompleted"
    />
  </div>
</template>

<script>
import Stepper from "../components/Stepper";
import ProgressBar from "../components/ProgressBar";
import Questionnaire from "../components/Questionnaire";
import Results from "../components/Results";

export default {
  components: {
    Stepper,
    ProgressBar,
    Questionnaire,
    Results,
  },
  data() {
    return {
      steps: ["Informations", "Questionnaire", "Résultat"],
      activeStep: 0,
      currentQuestion: 0,
      selectedAnswer: null,
      quizCompleted: false,
      score: 0,
      questions: [
        {
          question: "Quelle est la capitale de la France?",
          answers: ["Lvon", "Paris", "Marseille", "Toulouse"]
        }
      ]
    };
  }
};
```
